

The Tech-Line E-X1 end exit stall system simply ensures that each cow has her own space to eat and stand while being milked.

# *Tech-Line E-X1 End Exit Stall System*

**A relaxed cow will milk more freely, helping to make milking a more pleasant task.**

Based on the Pendulum style stall gate system, the E-X1 is basically closed to cows on the platform except for the last bail, ensuring cows always walk to the first cow position. As the first cow enters, the flap gate is activated, opening the second bail position, and so on.

Feed bins and breast rail, are all standard features.

A variety of entry and exit gate styles and controls are available to integrate with the stall system.

The latest improvement to the system is now using a pneumatic compressed air ram on each bail rather than the traditional vacuum cylinder.

A pneumatic ram ensures a positive movement every time, being able to lift the gate from between cows when tight together.

This also allows the plant vacuum and reserve to be used for what should be its only purpose – providing a quick, clean and efficient milking.

This pneumatic system can be included during the original install, or an option for a later date.
